Core System Government Financing Company in Indonesia

Background

The Core System was developed to coordinate and integrate data and information across different operational areas within the company's government financing business processes.

The system serves as an integrated platform that connects data and processes across operational areas, enabling better coordination, data consistency, and information flow throughout the business process.

Project Objectives

- Improve operational efficiency for users across branches, business units, and headquarters by providing an integrated system to support day-to-day activities.
- Streamline financing initiation processes by integrating and centralizing customer and financing application data captured through the mobile application.
- Support and streamline the customer disbursement process by providing the required data and workflow to facilitate financing realization.
- Reduce manual workload and operational effort for users at branch and business-unit levels through process integration and centralized data management.
- Enhance operational monitoring and performance visibility by enabling divisions and business units to monitor field activities and related operational data.
- Improve reporting capabilities by enabling branches and headquarters to retrieve and generate reports based on their operational and business requirements.

Approach

- Conducted stakeholder interviews and mapped As-Is vs To-Be workflows.
- Map business processes, data flows, and relationships between customer, financing application, disbursement, monitoring, and reporting processes.
- Translate business requirements into functional specifications, including business rules, system workflows, data requirements, and user interactions.

- Facilitated UAT and training session with stakeholders.

Key Deliverables

- Business Process Flow
- Business Requirements Documentation
- Functional Requirements Specification
- Business Rules & Validation Requirements
- Data & Field Mapping
- System Workflow
- Use Case / Functional Flow
- UI Design
- Reporting Requirements
- Supporting Requirement Documentation

Business Process Flow

The business process was mapped to illustrate the end-to-end flow of financing operations, from financing initiation and customer data management through the disbursement process, monitoring, and reporting.

Functional Design

- Functional requirements for each business process.
- System workflow and user interaction.
- Business rules and validation logic.
- Data and field requirements.
- Data relationships between operational processes.
- User roles and access requirements.
- Integration requirements between the Core System and related applications.

- Reporting and data retrieval requirements.

UI / Wireframe

- User workflow and navigation.
- Data input and form structure.
- Required fields and field validation.
- Information displayed to users.
- User actions and system responses.
- Alignment between the UI and underlying business rules.
